

Patient's Experience with Electronic Health Records

Nakhle A. Tarazi, MD

Why Choose the Subject

- There have been many studies on physician's experience about EHRs but there have few if any studies about patient's experience with EHRs.
- Therefore with the support of the Massachusetts Health Data Consortium we decided to conduct a pilot study of 50 patients whose physicians had recently converted from paper charts to EHRs.

Hypothesis

- The hypothesis was that EHR implementation would not significantly interfere with the physician-patient relationship.

Method

- 50 Questionnaires were handed to patients in the waiting room of different medical practices.
- 49 Questionnaires could be used.
- 4 Different practices were chosen.
- 15 Different Practitioners.

Time Spent With Provider

Eye Contact/Attention

Finding Information/labs/Reports

Wait Time in the Office

Total Time Spent in the Office

Overall Satisfaction with the Visit

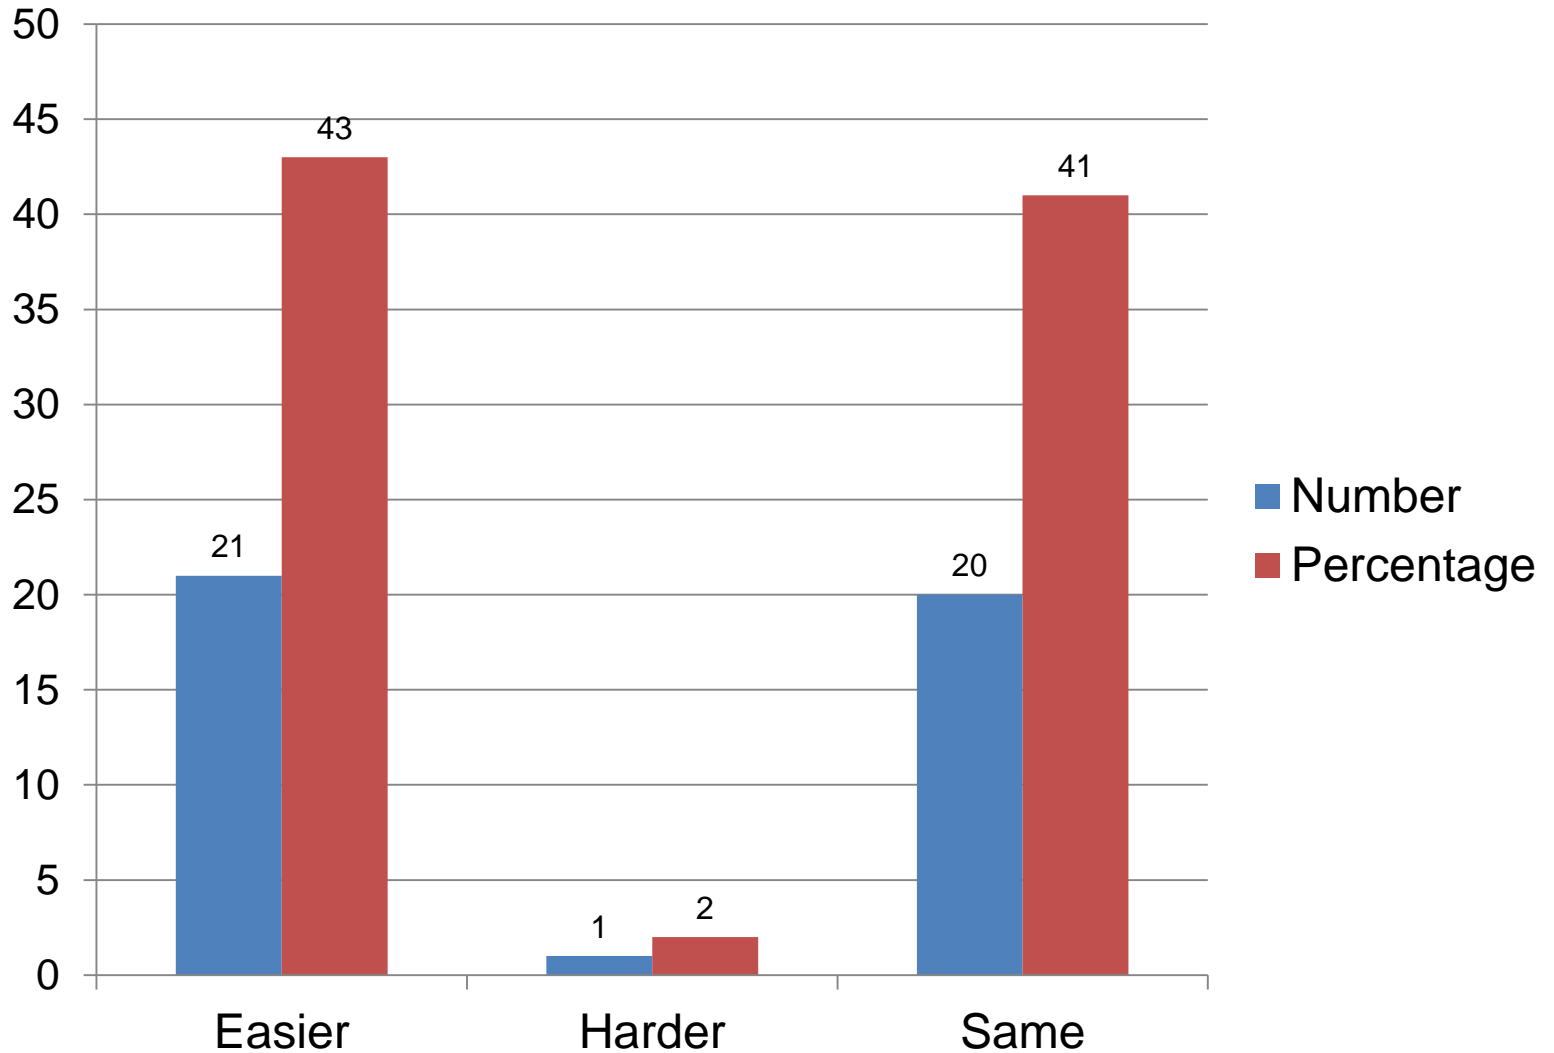

Did you feel the Doctor Listened to You?

How Easy Was the Check Out

How Easy Was the Check-In

Test Ordering: Paper vs. EHR

Was a Prescription Handed to You or Transmitted to the Pharmacy?

Answer	Number	Percentage
Paper	3	6
Transmitted	32	65
Both	2	4
Blank	12	25

If the Rx was transmitted to the pharmacy, how was the process?

Answer	Number	Percentage
Better	29	59
Worse	0	0
No Change	7	14
Blank	13	27

How Is Your Care Now?

Conclusion

1. Overall there has been little change in the perception of patients in the majority of questions we asked them when their doctor changed from paper to electronic records. And any change that was noted was positive
2. Patients felt that it was easier to check-in and check-out, order tests, send their prescriptions to the pharmacy , being referred to a specialist, and have the hospital access their records if they were referred there.
3. The patients felt that there was little change in their care once their provider started using EHRs compared to when they were using paper records. And any change was positive

Recommendations for Further Studies

1. A bigger patient sample
2. More in-depth interviews.
3. Multiple practice sites across regions or the country
4. Clarification of some of the questions: e.g. in purpose of the visit provide an opportunity to explain "other" .
5. Expand on the reason for the multiple visits to the doctor, compared to the visit at the time the questionnaire is submitted

Recommendations for Further Studies

6. Try to know more about the patients who expressed negative feelings

Thank You
